

Cardbase Conversion Utility

This program creates a new ATM-FILE record based on information in an old card record. If the old PIN was created using either DES or Diebold algorithms we can create a new Pin-Offset that will allow the old PIN to be used on the new card.

Features

- Converts data from an existing card record to a new record
- Can convert DES or Diebold algorithms so that the old PIN works on the new card for the member's convenience
- Converting the PINs saves money by reducing the cost of mailing the card and a separate PIN mailer, and increases member satisfaction
- Allows defaulting of data at a field level, to automatically populate or override from their current values
- Can use DFILES – Plastic Records to obtain the next card record so it is compatible with front office card issues. Also compatible with many other card numbering formats for almost limitless layout options.
- Ability to split a single card record with two names into two individual card records
- Detail report of cards produced and full exception reporting
- Validates card numbers before creation to eliminate the possibility of duplicating a card number on a different account
