

# History Extract

Now you can extract Monetary and Data Change history transactions from Spectrum and view it on a separate browser-based application.

## Features

- Keep more transaction history without the concern of slowing down the core system
- Make it easier to research special issues that now require you to go to archived statements or data change reports or both
- The data is loaded into a Microsoft SQL database
- The browser-based user interface provides functionality similar to a HIST command
- Role-based access security
- Can restrict access to sensitive accounts like employees and officials
- Administrative pages for loading and managing the extracted data
- Extract program options:
  - Selection based on tagfile of accounts
  - Date range of history to extract
