

Mini ISO Control Interface

Adds on-line real-time ability to load and update card records from Spectrum to the COOP or Postilion ATM controller database.

Mini ISO provides a limited amount of the functionality of a full blown ISO control program. Its purpose is to send the 382 or 322 messages needed to build a record in the COOP or Postilion database as needed throughout the day. Both new cards and updates to existing cards are handled on-line real-time. Includes the available suffix position values from the ATM record to insure proper functionality of the card. This solution makes the data available to Postilion as soon as it is created or modified in Spectrum. Summit's ISO control does not provide this functionality.

Features

- On-line real-time activation of new and reissued cards
- Immediate access for instant issuance
- Supports 382/392 and 322/332 message formats
- Runs during the hours Spectrum is up
- Provides a report of all new and changed records processed each day
